

FD2H001BY FD2H001BH

Low-Power Hall Switch

General Description

FD2H001B is a low-power integrated Hall switch designed to sense the applied magnetic flux density and give a digital output, which indicates the present condition of the magnitude sensed. One example of the applications is the on/off switch in cellular flip-phones.

The micro power design is especially suitable for battery-operated systems such as cellular phones or laptop computers, in which power consumption is one major concern. The typical power consumption of FD2H001B is below 10μ W at 2.7V.

The magnetic switching points are precise and insensitive to process and temperature variations.

For FD2H001B, the output will be at the "low" level if the applied magnetic flux density(North pole) is stronger than the switching threshold.

For detailed magnetic flux direction please refer to the figure.3

Features

- Micro power consumption
- > 2.4V to 5.5V battery operation
- Chopper Amplifier based design: Insensitive to noise and offset caused by process variations, operating temperatures and mechanical stress
- Digital output
- Programmable output direction
- CMOS process
- > Available in SOT23 / SIP3 package

FD2H001BY/SOT23

| Name | I/O | Description | |
|------|-----|-------------------|--|
| VDD | Р | Positive supply | |
| Q | 0 | Open Drain output | |
| VSS | G | Ground | |

Legend: I=input, O=output, I/O=input/output, P=power supply, G=ground

FD2H001BH/SIP3

This datasheet contains new product information. Feeling Technology reserves the rights to modify the product specification without notice. No liability is assumed as a result of the use of this product. No rights under any patent accompany the sales of the product.

Marking Information

Lot Number: Wafer lot number's last two digits

For Example: XX686 \rightarrow 86

Year: Production year's last digit

Internal ID: Internal Identification Code

Part Number Code: Part number identification code for this product.

Block Diagram

Figure.1

Functional Descriptions

Refer to the block diagram (Figure.1), FD2H001B is composed of the following building blocks:

• Bias generator

The bias generator provides precise, temperature and process insensitive current sources for both the Hall plate and the chopper amplifier. These current sources in turn guarantee proper operation of the chip and precise switching thresholds under all kinds of environments specified in the specification.

• Oscillator + Sequencer

The built-in oscillator provides the clock signal, which is taken by the sequencer to determine the periods of the operating phase and the stand-by phase. Typically the operating time is about 60us and the stand-by time is 150ms. Using such a clocking scheme, the average power consumption is almost equal to that in the stand-by phase, which is under 10μ W at 2.7V.

Power on Reset

Used to detect the power-up ramp and reset the digital circuits to attain correct operation as soon as the power is ready.

Chopper Amplifier

To achieve a higher resolution the chopper amplifier structure is adopted in this design. Use of this structure dynamically removes both the offset and flicker noise at the same time.

Hysteresis Control

This block determines the switching threshold of the Hall switch in different situations.
